● 本產品係採用最先進之矽基材料製成，具有極高之機械強度與穩定性，且具備以下優點：

- 1. 機械強度 - 抗拉強度 $\geq 50\text{Nm/kg}$ - 伸縮率 $>92\%$ - 抗彎曲半徑 $\leq 0.5\text{mm}$ - SMA 熱變形係數 $0.5\text{--}1.2\text{mm}/^\circ\text{C}$
- 2. 控制系統 - DSP 數位控制系統，反應時間 $<0.8\text{ms}$ - 定位精度 $\pm 0.01\text{N}\cdot\text{m}$
- 3. 溫度控制 - 溫度範圍 $52^\circ\pm 0.5^\circ\text{C}$ - 溫度均勻性 $\pm 0.5^\circ\text{C}$ - 溫度穩定性 $\pm 0.01^\circ\text{C}$
- 4. 材料特性 - 材料密度 $4096\text{g}/\text{cm}^3$ - 材料硬度 $0.5\text{--}5\text{N/mm}$ - 材料韌性 $1\text{--}5\text{J/m}^2$
- 5. 外觀設計 - 外觀尺寸 $72\text{mm}\times 72\text{mm}\times 72\text{mm}$ - 外觀顏色 $\pm 3\text{D}$ - 外觀光澤度 $\pm 1\%$
- 6. 性能表現 - 性能表現 600Wh/kg - 性能表現 $\text{Qi } 1.3$ - 性能表現 85% - 性能表現 $>30\%$
- 7. 包裝規格 - 包裝規格 $1\text{--}5\text{mm}$ - 包裝規格 Lockstep - 包裝規格 $<5\text{ms}$ - 包裝規格 $500+$
- 8. 其他資訊 - 其他資訊 $>75\%$ - 其他資訊 3D - 其他資訊 60% - 其他資訊 $\text{ISO } 13482$ - 其他資訊 $\text{ISO/TC } 299$
- 9. 其他資訊 - 其他資訊 18 - 其他資訊 $500\text{--}800$ - 其他資訊 12 - 其他資訊 $1200\text{--}1500$ - 其他資訊 6 - 其他資訊 3000 - 其他資訊 $20+$
- 10. 其他資訊 - 其他資訊 AI

● **1. 硬體層面**：硬體層面是指物理層面的硬體設備，包括 CPU、MCU、感測器、執行器、通訊模組等。硬體層面的設計是系統設計的第一階段，也是最重要的階段。硬體層面的設計需要考慮到系統的功耗、成本、性能、可靠性等因素。硬體層面的設計需要選擇合適的硬體設備，並進行電路設計、PCB 佈局、元件採購等工作。

测试
system = RedundantSystem()
if not system.primary:
system.switch_to_backup()
python

```

[illegible]

### 1. 背景

随着深度学习“AI”的普及，越来越多的企业开始使用GPU和TPU来加速深度学习模型的训练和推理。然而，由于GPU和TPU的硬件架构和编程模型与传统的CPU不同，因此需要开发新的工具和框架来支持深度学习模型的训练和推理。

Python TensorFlow

```
python
import tensorflow as tf

#
model = tf.keras.Sequential([
 tf.keras.layers.Dense(128, activation='relu', input_shape=(input_size,)),
 tf.keras.layers.Dense(64, activation='relu'),
 tf.keras.layers.Dense(output_size, activation='softmax')
])

#
model.compile(optimizer='adam', loss='sparse_categorical_crossentropy',
metrics=['accuracy'])
```

---

2.

Arduino

```
cpp
#include <Servo.h>

Servo fingerServo;

void setup() {
 fingerServo.attach(9); // 9
}

void loop() {
 fingerServo.write(0); //
 delay(1000);
 fingerServo.write(180); //
 delay(1000);
}
```

---

3.

TensorFlow PyTorch

# PyTorch 入門

```

"""python
import torch
import torch.nn as nn

class BrainNet(nn.Module):
 def __init__(self):
 super(BrainNet, self).__init__()
 self.fc1 = nn.Linear(input_size, 128)
 self.fc2 = nn.Linear(128, 64)
 self.fc3 = nn.Linear(64, output_size)

 def forward(self, x):
 x = torch.relu(self.fc1(x))
 x = torch.relu(self.fc2(x))
 x = self.fc3(x)
 return x
"""

```

— — —

4.

# Arduino

```

`cpp
const int sensorPin = A0;

void setup() {
 Serial.begin(9600);
}

void loop() {
 int sensorValue = analogRead(sensorPin);
 Serial.println(sensorValue);
 delay(1000);
}
`

```

— — —

## 5. GPIO

아래는 Python 으로 GPIO 제어

```
```python
import RPi.GPIO as GPIO

GPIO.setmode(GPIO.BCM)
GPIO.setup(17, GPIO.OUT)

GPIO.output(17, GPIO.HIGH) # 출력
```
```

---

6. OpenCV와 SpeechRecognition 라이브러리 설치

아래는 OpenCV와 SpeechRecognition 라이브러리 설치

```
```python
import cv2
import speech_recognition as sr

# 카메라
cap = cv2.VideoCapture(0)
while True:
    ret, frame = cap.read()
    cv2.imshow('frame', frame)
    if cv2.waitKey(1) & 0xFF == ord('q'):
        break
cap.release()
cv2.destroyAllWindows()

# 마이크
recognizer = sr.Recognizer()
with sr.Microphone() as source:
    audio = recognizer.listen(source)
text = recognizer.recognize_google(audio)
print(text)
```
```

---

7. Arduino에 PID 제어

아래는 Arduino에 PID 제어

```

```cpp
#include <PID_v1.h>

double Setpoint, Input, Output;
double Kp=2, Ki=5, Kd=1;
PID myPID(&Input, &Output, &Setpoint, Kp, Ki, Kd, DIRECT);

void setup() {
  Setpoint = 100; // 목표값
  myPID.SetMode(AUTOMATIC); // PID 모드 설정
}

void loop() {
  Input = readSensor(); // 센서값 읽기
  myPID.Compute(); // PID 계산
  setMotor(Output); // 모터값 설정
}
```

```

---

8. Hugging Face Transformers 라이브러리

이 코드는 Hugging Face Transformers 라이브러리를 사용하여

```

```python
from transformers import pipeline

generator = pipeline('text-generation', model='gpt-2')
result = generator("Hello, how are you?", max_length=50)
print(result)
```

```

---

9. MySQL과 MongoDB 데이터베이스 연결

이 코드는 MySQL 데이터베이스에 연결하는

```

```python
import mysql.connector

db = mysql.connector.connect(

```

```
host="localhost",
user="yourusername",
password="yourpassword",
database="robotdb"
)
```

```
cursor = db.cursor()
cursor.execute("SELECT * FROM knowledge")
result = cursor.fetchall()
for row in result:
    print(row)
````
```

---

10.

# Python 入門

```

python
def check_hardware_status():
 #

```

---

### **8. 初始化 LanguageSystem 类**
```python
class LanguageSystem:
def __init__(self):
初始化 GPT
self.consciousness_engine = ConsciousnessStream()
初始化 BioVocal
self.vocal_cords = BioVocal(emotion_map="pleasure_anger_sadness")

def respond(self, input_text):
初始化 input_text
thought = self.consciousness_engine.generate_thought(input_text)
speech = self.vocal_cords.convert_to_speech(thought)
return speech
```

---

### **9. 初始化 BrainDatabase 类**
```python
class BrainDatabase:
def __init__(self):
初始化 memory
self.memory = DynamicKnowledgeGraph()
初始化 knowledge_graph
```

```

```
```python
```

```

import tensorflow as tf
from tensorflow.keras.models import Sequential
from tensorflow.keras.layers import Dense, LSTM, Embedding

实现LSTM模型
class MindModel:
 def __init__(self, input_shape, output_shape):
 self.model = Sequential()
 self.model.add(LSTM(128, input_shape=input_shape, return_sequences=True))
 self.model.add(LSTM(64))
 self.model.add(Dense(64, activation='relu'))
 self.model.add(Dense(output_shape, activation='softmax'))
 self.model.compile(optimizer='adam', loss='categorical_crossentropy',
 metrics=['accuracy'])

 def train(self, X_train, y_train, epochs=10):
 self.model.fit(X_train, y_train, epochs=epochs)

 def predict(self, X_test):
 return self.model.predict(X_test)

测试模型
mind_model = MindModel(input_shape=(100, 64), output_shape=10)
mind_model.train(X_train, y_train, epochs=20)

```

```

2. 实现OpenAI Gym环境

```

```

```python
import gym
import numpy as np

# 实现HandReach环境
class HandController:
    def __init__(self, env_name='HandReach-v0'):
        self.env = gym.make(env_name)
        self.state_size = self.env.observation_space.shape[0]
        self.action_size = self.env.action_space.shape[0]

    def train(self, episodes=1000):
        for episode in range(episodes):
            state = self.env.reset()
            done = False
            while not done:
                action = self.env.action_space.sample() # 随机动作
                next_state, reward, done, _ = self.env.step(action)
                state = next_state

# 测试HandController
hand_controller = HandController()
hand_controller.train(episodes=1000)

```

```

### 3. Transformer
Transformer

```python
from transformers import GPT2LMHeadModel, GPT2Tokenizer

GPT-2
class BrainModel:
 def __init__(self, model_name='gpt2'):
 self.tokenizer = GPT2Tokenizer.from_pretrained(model_name)
 self.model = GPT2LMHeadModel.from_pretrained(model_name)

 def generate_text(self, prompt, max_length=50):
 inputs = self.tokenizer.encode(prompt, return_tensors='pt')
 outputs = self.model.generate(inputs, max_length=max_length,
 num_return_sequences=1)
 return self.tokenizer.decode(outputs[0], skip_special_tokens=True)

#
brain_model = BrainModel()
generated_text = brain_model.generate_text(" ")
print(generated_text)
```

```

```

### 4.
Transformer

```python
import numpy as np

#
class SkinSensor:
 def __init__(self, sensor_data):
 self.sensor_data = sensor_data

 def process_data(self):
 #
 return np.mean(self.sensor_data, axis=0)

#
sensor_data = np.random.rand(100, 10) # 100 10
skin_sensor = SkinSensor(sensor_data)
processed_data = skin_sensor.process_data()
print("Processed Sensor Data:", processed_data)
```

```

```

### 5.
Transformer

```python
#
class ChestModule:
 def __init__(self, module_name):
 self.module_name = module_name

```

```
def perform_task(self):
 print(f"{self.module_name} is performing its task.")
```

```
테스트
power_module = ChestModule("Power Module")
sensor_module = ChestModule("Sensor Module")
power_module.perform_task()
sensor_module.perform_task()
````
```

6. OpenCV와 SpeechRecognition을 활용한 비전 및 음성 인식 시스템

```
```python
import cv2
import speech_recognition as sr

비전 시스템
class VisionSystem:
 def __init__(self):
 self.camera = cv2.VideoCapture(0)

 def capture_image(self):
 ret, frame = self.camera.read()
 return frame

음성 인식 시스템
class HearingSystem:
 def __init__(self):
 self.recognizer = sr.Recognizer()

 def recognize_speech(self, audio_file):
 with sr.AudioFile(audio_file) as source:
 audio = self.recognizer.record(source)
 return self.recognizer.recognize_google(audio)

시스템 실행
vision_system = VisionSystem()
image = vision_system.capture_image()
cv2.imwrite("captured_image.jpg", image)

hearing_system = HearingSystem()
text = hearing_system.recognize_speech("audio_file.wav")
print("Recognized Text:", text)
````
```

7. Inverse Kinematics와 PyBullet을 활용한 로봇 시뮬레이션

```
```python
import pybullet as p

환경 설정
```

```

class ArmController:
def __init__(self):
self.physicsClient = p.connect(p.GUI)
p.setGravity(0, 0, -10)
self.robot = p.loadURDF("robot_arm.urdf")

def move_arm(self, target_position):
joint_positions = p.calculateInverseKinematics(self.robot, 6, target_position)
for i in range(len(joint_positions)):
p.setJointMotorControl2(self.robot, i, p.POSITION_CONTROL, joint_positions[i])

```

```

실행
arm_controller = ArmController()
arm_controller.move_arm([0.5, 0.5, 0.5])
```

```

```

### 8. 강화학습을 위한 환경 구현
환경을 구현하는 클래스를 정의합니다.

```

```

```python
import numpy as np

```

```

강화학습 환경
class LanguageModel:
def __init__(self, vocab_size, state_size):
self.vocab_size = vocab_size
self.state_size = state_size
self.q_table = np.zeros((state_size, vocab_size))

```

```

def choose_action(self, state):
return np.argmax(self.q_table[state, :])

```

```

def update_q_table(self, state, action, reward, next_state):
self.q_table[state, action] += reward + 0.9 * np.max(self.q_table[next_state, :])

```

```

실행
language_model = LanguageModel(vocab_size=100, state_size=50)
state = 0
action = language_model.choose_action(state)
language_model.update_q_table(state, action, reward=1, next_state=1)
```

```

```

### 9. 데이터베이스를 위한 환경 구현
데이터베이스를 구현하는 클래스를 정의합니다. SQLAlchemy을 사용합니다.

```

```

```python
from sqlalchemy import create_engine, Column, Integer, String
from sqlalchemy.ext.declarative import declarative_base
from sqlalchemy.orm import sessionmaker

```

```

데이터베이스
Base = declarative_base()

```

```

class Knowledge(Base):

```

```

__tablename__ = 'knowledge'
id = Column(Integer, primary_key=True)
fact = Column(String)
context = Column(String)

실행
engine = create_engine('sqlite:///knowledge.db')
Base.metadata.create_all(engine)
Session = sessionmaker(bind=engine)
session = Session()

데이터 저장
new_knowledge = Knowledge(fact="인공지능", context="인공지능")
session.add(new_knowledge)
session.commit()

데이터 조회
knowledge = session.query(Knowledge).filter_by(fact="인공지능").first()
print(knowledge.context)
`

```

### 10. 스레딩을 이용한 Python 프로그램

```

`python
import threading
import time

BackupSystem 클래스
class BackupSystem:
 def __init__(self):
 self.backup_data = []

 def backup(self, data):
 self.backup_data.append(data)
 print(f"Backup: {data}")

BackupSystem 객체 생성
backup_system = BackupSystem()

def task(data):
 backup_system.backup(data)

threads = []
for i in range(5):
 t = threading.Thread(target=task, args=(f"Data {i}",))
 threads.append(t)
 t.start()

for t in threads:
 t.join()
`

1. 引言

- **背景**：随着人工智能技术的飞速发展，机器人在各个领域的应用越来越广泛。特别是在服务机器人领域，如何提高机器人的自主性和智能化水平成为了研究的重点。

- **目的**：本文旨在探讨一种基于深度学习的机器人自主导航方法，通过引入强化学习算法，提高机器人在复杂环境中的导航效率和适应性。

- **意义**：本研究对于推动服务机器人的智能化发展具有重要的理论意义和实际应用价值。

2. 相关工作

2.1 机器人导航技术

机器人导航技术是机器人领域的核心问题之一。传统的导航方法主要依赖于预先构建的环境地图和全局路径规划算法。然而，这些方法在动态环境中往往表现不佳。近年来，基于深度学习的导航方法逐渐兴起，通过引入神经网络和强化学习算法，提高了机器人在复杂环境中的导航能力。本文参考了相关文献，如 wenku.csdn.net/doc/7pkt_。

2.2 强化学习在机器人导航中的应用

强化学习是一种通过试错来学习最优策略的机器学习方法。在机器人导航中，强化学习可以用于学习最优的导航策略。本文参考了相关文献，如 wenku.csdn.net/doc/7pkt_。

2.3 深度学习在机器人导航中的应用

- **卷积神经网络 (CNN)**：用于提取环境特征，如障碍物和目标的形状和位置。

- **循环神经网络 (RNN)**：用于处理时间序列数据，如机器人的运动轨迹和传感器的输出。

- **强化学习 (RL)**：用于学习最优的导航策略，通过不断试错来优化机器人的行为。

3. 系统架构

本文提出的系统架构如图1所示。系统主要由感知模块、决策模块和执行模块组成。感知模块负责收集环境信息，决策模块负责根据感知信息做出导航决策，执行模块负责执行决策并控制机器人的运动。本文参考了相关文献，如 wenku.csdn.net/doc/7pkt_。

1. 系统概述：本文研究的是一种基于深度学习的机器人自主导航系统。该系统旨在提高机器人在复杂环境中的导航效率和适应性。系统主要由感知模块、决策模块和执行模块组成。感知模块负责收集环境信息，决策模块负责根据感知信息做出导航决策，执行模块负责执行决策并控制机器人的运动。

2. 系统架构：本文提出的系统架构如图1所示。系统主要由感知模块、决策模块和执行模块组成。感知模块负责收集环境信息，决策模块负责根据感知信息做出导航决策，执行模块负责执行决策并控制机器人的运动。

3. 系统实现：本文详细描述了系统的实现过程。首先，我们设计了一个基于深度学习的神经网络结构，用于提取环境特征。然后，我们使用强化学习算法训练该神经网络，使其能够学习最优的导航策略。最后，我们将训练好的模型部署到实际的机器人系统中，进行实验验证。

4. 实验结果：本文通过实验验证了所提出系统的性能。实验结果表明，该系统在复杂环境中的导航效率和适应性得到了显著提高。与传统的导航方法相比，该系统能够更好地应对动态环境中的变化和不确定性。

5. 结论与展望：本文的研究为机器人自主导航领域提供了一种新的思路和方法。未来，我们将继续深入研究，进一步优化系统的性能和鲁棒性，推动服务机器人的智能化发展。

● 本文的研究为机器人自主导航领域提供了一种新的思路和方法。未来，我们将继续深入研究，进一步优化系统的性能和鲁棒性，推动服务机器人的智能化发展。

● ROS のインストールと環境構築

1. ROS のインストール

- Ubuntu 16.04 LTS (Xenial Xerus) をインストールする
- ROS のインストール

2. ROS の環境構築

ROS の環境構築は、以下の手順で行う。

$$S(t_i) = \begin{cases} S_1 & \text{if } C_1(t_i) \\ S_2 & \text{if } C_2(t_i) \\ \vdots & \\ S_n & \text{if } C_n(t_i) \end{cases}$$

$$(S(t_i), C(t_i)) \in (S_1, S_2, \dots, S_n) \times (C_1(t_i), C_2(t_i), \dots, C_n(t_i))$$

3. ROS の環境構築

- ROS のインストール
- ROS の環境構築

4. ROS の環境構築

ROS の環境構築は、以下の手順で行う。

1. ROS のインストール

ROS のインストールは、以下の手順で行う。

multi_task`

move_base`

pick_object`

2. Launch の実行

Launch の実行は、以下の手順で行う。

xml<group ns="pick_object"> <include file="\$(find pick_object)/launch/pick_object.launch"/></group>`

3. ROS の環境構築

ROS の環境構築は、以下の手順で行う。

API`

move_base`

5. ROS の環境構築

- ROS のインストール
- ROS の環境構築

●Python 语音识别与语音合成

```
python import speech_recognition as srimport pytsx3# 初始化 recognizer 和 engine
r = sr.Recognizer()engine = pytsx3.init()def listen(): with sr.Microphone() as source:
print("...") audio = r.listen(source) try: text = r.recognize_google(audio,
language='zh-CN') print(f"识别到: {text}") return text except
sr.UnknownValueError: print("无法识别") return "" except sr.RequestError as e:
print(f"请求错误: {e}") return ""def speak(text): engine.say(text)
engine.runAndWait() # 语音合成
python # 定义关节状态
joint_states = { "neck": 0, "left_arm": 0, "right_arm": 0, "left_leg": 0, "right_leg": 0,
"left_hand_fingers": [0, 0, 0, 0, 0], "right_hand_fingers": [0, 0, 0, 0, 0]}def
move_joint(joint, angle): if joint in joint_states: joint_states[joint] = angle
print(f"{joint} 移动到 {angle} 度") else: print(f"未知关节: {joint}")def
move_fingers(hand, angles): finger_joints = f"{hand}_hand_fingers" if

1. 3C 2. Optimus 3. 4. 5. Pepper 6. 7. Design and Development of Super-advanced Intelligent Humanoid Robot

Design and development of super-advanced intelligent humanoid robot design program code, including mechatronics, automatic control servo driver, detailed design of core components, software and hardware system, brain design, body diary, limbs, especially the five fingers of the hand, are flexible to 50 degrees. The neck is flexible, hands and feet are equally important, you can talk to yourself and communicate with human beings, the movements of the five senses and limbs are developed, you can sleep, get up, run and dance freely, weigh 60/70 kilograms, have different models, and have a height of 1.5/1.6 meters. It can be used continuously for 24 hours with long-acting livestock batteries. It is made of composite metal materials, precision machinery, miniaturization, lightweight, durability, standardization, universality, technical redundancy, safety and practicality. Multi-function and multi-purpose, suitable for daily life, work, study, labor, entertainment and sports, etc., bionic simulation, truly integrating man and machine, advanced intelligent robot exceeds all kinds of humanoid robots at home and abroad, and the manufacturing cost is 50-100 thousand yuan, the popular type is 300-500 thousand yuan, and the advanced model is 100-200-5 million yuan, which is suitable for commercial production.

●● Price (1) 50,000-100,000 yuan for low level, 100,000-200,000 yuan for intermediate level, 300,000-500,000 yuan for ordinary high level, 500-1,000,000 yuan for advanced level, 1,000-5,000,000 yuan for export of high-end type, and 2,000-5,000,000 dollars for ultra-advanced intelligent robot design. Because it involves interdisciplinary complex system integration and trade secret protection, it is The following is a detailed analysis of the technical framework and core modules:

1. Design of mechatronics system
 1. Drive system architecture-micro harmonic reduction motor (torque density $\geq 50\text{Nm/kg}$)- three-stage planetary gear transmission system (transmission efficiency $> 92\%$)- bionic tendon structure (carbon fiber -SMA composite material, Strain rate 0.5-1.2 mm/)
 2. Automatic control system
 1. Servo drive module-dual DSP architecture (Titms 320F28379D+Xilinx ZNQ ultrascale+MPSOC)-adaptive PID algorithm (response time $< 0.8\text{ms}$)- six-axis force feedback system (resolution 0.01N·m)
 3. Bionic motion system
 1. Hand mechanism-5-DOF modular finger (bending angle 52 0.5)-piezoelectric tactile sensor array (4096 points/cm)- variable stiffness mechanism (0.5-5N/mm continuous adjustment)
 4. Intelligent interactive system
 1. Multi-modal interactive engine-hybrid dialogue system (GPT-4 architecture+domain knowledge map)-micro-expression generation system (72 groups of facial actuation units)-multi-channel perception fusion (lidar+millimeter wave +3D structured light)
 5. Energy and power system
 1. High-density energy module-solid lithium-sulfur battery pack (energy density 600Wh/kg)- wireless charging system (wireless charging system) Efficiency 85%)- Energy recovery device (kinetic energy conversion rate $> 30\%$)
 - VI. Safety redundancy design
 1. Triple fault-tolerant architecture-Three-mode redundancy of main control chip (Lockstep architecture)-Emergency braking system (response time $< 5\text{ms}$)- Self-check diagnosis module (500+ health status parameters)
 - VII. Cost control scheme
 1. Mass production optimization strategy-modular design (generalization rate $> 75\%$)- mixed manufacturing process (3D printing+precision casting)-hierarchical management of supply chain (autonomy rate of core components is 60%)

Note: The specific implementation needs to comply with robot safety standards such as ISO 13482 and ISO/TC 299, and it is recommended to adopt phased development strategy: 1. Prototype verification stage (18 months, Investment of 5-8 million) 2. Engineering prototype stage (12 months, investment of 12-15 million) 3. Mass production preparation stage (6 months, production line investment of 30 million+). It is suggested to give priority to the development of core control algorithms and drive systems and establish patent barriers (20+ invention patents can be applied). If further

technical details are needed, it is suggested to form an interdisciplinary team (experts in the fields of machinery, electronics, AI, materials, etc.) to carry out special research. ●1. Technical feasibility analysis:-At present, the single cost of the world's most advanced biped robot (such as Boston Dynamics Atlas) exceeds 2 million US dollars.-The single price of miniaturized high-precision servo motors (such as maxon EC series) is 3,000-8,000 yuan.-High-energy-density batteries (such as Tesla 4680) still need to break through to reach 24-hour battery life. 2. Suggestions on the architecture of core technology modules. : [Hardware system]-Bionic skeleton: titanium alloy 3D printing skeleton (40% weight reduction)-Driving system: self-made magnetically coded servo motor (0.05 accuracy)-Sensing system: multi-modal sensor fusion array (16 channels IMU+3D LiDAR)[Software architecture] -Real-time operating system: ROS2+Linux RT kernel-Motion control: gait generation algorithm based on reinforcement learning-Human-computer interaction: multi-modal large language model (localized deployment) 3. Implementation example of key technologies (Python pseudocode): ```python# Multi-joint motion control algorithm class biomimetic controller: def __init__(self): self.muscle_model = hilltypemodel() self.balance_ctrl = zmpcontroller() def dynamic_balance(self, sensor_data): com = self.calculate_center_of_mass() zmp = self.balance_ctrl.compute_zmp(com, sensor_data) torque = self.muscle_model.compute_torque(zmp) return self.apply_torque_distribution(torque)# The core logic of dialogue system is classcognitive engine: defprocess_input(self, text, vision, audio): context = self.multimodal_fusion(text, vision, audio) intent = self.intent_recognition(context) return self.knowledge_graph.query(intent)``` 4. Suggestions on the commercial realization path:-The first stage (2-3 years): developing the basic platform of education version (the price is 80,000 yuan)-The second stage (5 years): realizing medical care/ Service Professional Edition (priced at RMB350,000)-The third stage (8-10 years): Complete the fully functional humanoid robot. 5. Safety and ethical considerations:-Need to pass the ISO 13482 safety certification-Set the three-level physical safety switch-Follow the AI ethical standards (including the extended version of Asimov's Three Principles). The research and development of this level of robot needs to set up a team with at least the following experts:-Mechanical engineer (5 people+)-Control algorithm expert. -AI researcher (3 people+)-Electronic engineer (2 people+)-Industrial designer (2 people+) suggested giving priority to the development of application versions of specific scenarios (such as rehabilitation robots) and gradually evolving to general use. The complete technical scheme needs to be obtained through authentication channels after signing NDA. Under the current technical conditions, it is suggested to adopt modular design ideas, focusing on breaking through the two core problems of dexterous hand operation and dynamic balance control. Specific technical documents can refer to the latest research results of IEEE Humanoid Robotics. Designing an ultra-advanced intelligent robot involves many complex engineering fields, including mechanical design, electronic engineering, software programming, artificial intelligence, material science and so on. ### 1. Electromechanical integration design is the core of robot design, involving the integration of mechanical structure, electronic control and sensor system. # # # 1.1 Mechanical structure design-* * Body structure * *: Lightweight composite metal materials (such as aluminum alloy and titanium alloy) and carbon fiber composite materials are adopted to ensure strength and lightweight. -* * Limb design * *: The limbs are designed in a modular way, and the joints use high-precision servo motors and reducers to ensure flexibility and load capacity. -* * Hand design * *: Five-finger design adopts bionics principle, each finger has three joints, and micro servo motor and flexible sensor are used to realize highly flexible operation ability (above 50

degrees). -** Neck design **: The neck is designed with multiple degrees of freedom, and servo motors and precision bearings are used to ensure flexible rotation and stability. ### 1.2 Electronic control system-** Servo driver **: High-performance servo driver is adopted to support high-precision position control and torque control. -** Sensor system **: including force sensor, gyroscope, accelerometer, visual sensor (camera), infrared sensor, etc., used for environmental perception and motion control. -** Power management **: Long-lasting lithium battery pack is adopted to support 24-hour continuous use, and intelligent power management system is equipped to optimize energy consumption. ### 2. Automatic control and servo driver-** Motion control algorithm **: PID control algorithm or more advanced model predictive control (MPC) algorithm is used to ensure the accuracy and stability of robot motion. -** Servo driver **: It adopts digital servo driver and supports CAN bus or EtherCAT communication protocol to realize high-speed and high-precision motion control. ### 3. Detailed design of core components-** Servo motor **: Miniaturized design, high power density and fast response. -** Reducer **: Use harmonic reducer or planetary reducer to ensure high torque output and low backlash. -** Sensor module **: It integrates various sensors to realize multi-modal sensing. ### 4. Software system design ### 4.1 Operating system-Real-time operating system (RTOS) such as FreeRTOS or ROS (Robot Operating System) is adopted to ensure real-time performance and multi-task processing ability. ### 4.2 Artificial Intelligence and Machine Learning-** Speech Recognition and Synthesis **: Use deep learning model (such as Transformer) to realize natural language processing (NLP), which supports soliloquy and human interaction. -** Computer Vision **: Convolutional Neural Network (CNN) is used for image recognition and target tracking. -** Motion planning **: Use reinforcement learning (RL) algorithm for motion planning and optimization. ### 4.3 Control software-** Motion control module **: realize the motion control of the robot, including gait generation and balance control. -** Task scheduling module **: manages the robot's task execution and supports multi-task parallel processing. ### 5. Hardware system design-** Main control unit **: High-performance embedded processor (such as ARM Cortex-A series or NVIDIA Jetson series) is adopted to support multi-core parallel computing. -** Communication module **: supports communication protocols such as Wi-Fi, Bluetooth and 5G, and ensures the seamless connection between the robot and external devices. -** Storage module **: High-speed solid state drive (SSD) is adopted to ensure data storage and reading speed. ### 6. Brain design-** Neural network architecture **: Deep neural network (DNN) and recurrent neural network (RNN) are adopted to realize advanced cognitive function and decision-making ability. -** Memory module **: The distributed storage system is used to support long-term memory and short-term memory. ### 7. Body design-** Appearance design **: Bionics design is adopted, the appearance is close to that of human beings, and composite metal and flexible materials are used to ensure beauty and durability. -** Internal structure **: Modular design, easy to maintain and upgrade. ### 8. Diary function-** Log record **: The robot can automatically record daily activities and interaction information and store it in a local log file. -** Data analysis **: Use machine learning algorithm to analyze the log data and optimize the behavior mode of the robot. ### 9. Limb design-** Hand design **: Five fingers are highly flexible, each finger has three joints, and micro servo motors and flexible sensors are used to support fine operation. -** Foot design **: bionic design is adopted to support complex sports such as running and dancing. ### 10. Design of five senses-** Vision system **: Use high-definition camera and depth sensor to support 3D vision and environmental perception. -** Auditory system **: Using microphone array and speech

américain est réglé en monnaie internationale commune. Les dessins techniques, les dessins brevetés, les codes de programme technologiques intelligents, etc. fournissent également des dessins techniques en version papier ou électronique. La description technique du brevet est principalement bilingue en chinois et en anglais. Les demandes de brevets chinois ou internationaux sont détenues par l'acheteur. Le contrat de secret d'affaires de transfert de technologie est principalement en anglais. Une fois que la signature produit des effets juridiques, la partie défaillante est responsable de la violation. Il s'adresse principalement aux fabricants nationaux et étrangers.
